

Conservative Therapy Logs

Provider: Apex Physical Therapy & Rehabilitation

Patient: Arthur Pendelton

Date Range: March 15, 2026 - June 20, 2026

Treatment Summary:

Patient was seen twice weekly for a continuous trial of conservative non-surgical management lasting 14 weeks.

Weeks 1-4: Focus on manual therapy, patellar mobilization, and isometric quadriceps strengthening. Patient reported pain levels at 7/10 during activity.

Weeks 5-8: Progressed to closed-chain kinetic exercises and stationary cycling. Patient received an intra-articular corticosteroid injection on April 12 by his PCP, which provided only temporary 10-day relief.

Weeks 9-14: Continued strength and mobility conditioning.

Discharge Status:

Despite over 12 weeks of documented, supervised physical therapy and concurrent pharmacological management, the patient has plateaued. Range of motion remains restricted (flexion limited to 95 degrees), and weight-bearing pain persists. Discharged back to referring physician for surgical consultation.
