

README

PA Evidence Assistant — Synthetic Test Data Set (v2)

All patients, providers, member IDs, and clinical details in this folder are **entirely fictional**, generated for testing the Elevance Prior Authorization Evidence Assistant. Nothing here is real PHI.

Structure

policies/ — 4 payer policy documents to ingest via admin policy ingestion
cases/<service>/<case-id>/ — one folder per case, containing the documents for that case only
answer-key.md — grading reference (see note below — do not upload this)

Each case folder contains the individual documents that would be uploaded as attachments for that PA request — a request form plus whichever clinical records (consultation notes, imaging reports, therapy summaries, medication lists, diaries, etc.) apply to that specific case. Every document reads as an independent, self-contained clinical record — there is nothing in any case document that identifies it as test data or hints at what the system should conclude.

Policies

File	Service	CPT
01-mri-lumbar-spine-policy.md	MRI Lumbar Spine	72148
02-total-knee-arthroplasty-policy.md	Total Knee Arthroplasty	27447
03-icd-implantation-policy.md	ICD Implantation (Primary Prevention)	33249
04-botox-chronic-migraine-policy.md	OnabotulinumtoxinA for Chronic Migraine	64615/J0585

Cases

16 cases total, 4 per policy, in cases/<service>/<case-id>/ . Case IDs are arbitrary identifiers and carry no meaning about the case's content.

How to use this set

1. Ingest each file under policies/ via the admin policy-ingestion flow.
2. For each folder under cases/ , submit a new PA request using the pa-request-form.md contents for the case metadata, and upload every other document in that same folder as case attachments.
3. Run the completeness check and record the system's output per requirement.
4. Only after recording the system's output, open answer-key.md to compare — that file is

for grading only and should never itself be submitted as a case document.
