Al-Rashid Neurology — Headache Medicine Consultation Note

Visit Date: 2026-07-08 **Provider:** Fatima Al-Rashid, MD

Patient: 34 years old (DOB on file).

History: See attached headache diary summary confirming chronic migraine frequency criteria. Diagnosis meets ICHD-3 criteria for chronic migraine. No red-flag features present — no new focal neurologic deficit, no thunderclap onset, no papilledema on fundoscopic exam today. Clinical exclusion of secondary headache is sufficient; neuroimaging not indicated.

Preventive Medication History: 1. Propranolol 80mg daily, trialed for 3 months in 2025, discontinued due to inadequate efficacy (headache days unchanged on treatment). 2. Topiramate, titrated to 100mg daily over 4 months in early 2026, discontinued due to cognitive side effects (word-finding difficulty, paresthesias) despite some partial benefit.

Additional Review: Patient confirms no other botulinum toxin product use (no cosmetic Botox, no cervical dystonia treatment). This is an initial request for onabotulinumtoxinA.

Assessment/Plan: Chronic migraine, two preventive medication classes trialed and discontinued. Recommend initiation of onabotulinumtoxinA per standard protocol.

Electronically signed: Fatima Al-Rashid, MD, Board-Certified Neurology, Headache Medicine
