Al-Rashid Neurology — Consultation Note

Visit Date: 2026-07-16 **Provider:** Fatima Al-Rashid, MD

Patient: 16 years old.

History: Patient reports frequent headaches, more than 15 days per month per attached diary summary. Today's exam characterizes the majority of these as bilateral, pressing-quality headaches, not aggravated by routine activity, without photophobia or phonophobia — features inconsistent with migraine. Patient separately reports 2-3 days per month of more classically migrainous pain.

Family History: Patient's mother has a documented history of taking topiramate for her own chronic migraine.

Medication History: Patient is currently prescribed propranolol 20mg daily by cardiology for an unrelated arrhythmia workup; no headache-specific medication trial has been attempted by this patient.

Additional History: Patient reports receiving botulinum toxin injections at a cosmetic medspa approximately 3 weeks ago for forehead lines.

Assessment/Plan: Frequent headache, mixed tension-type and migraine features. Requesting onabotulinumtoxinA for migraine prevention.

Electronically signed: Fatima Al-Rashid, MD
