Crossroads Urgent Care — Visit Note

Visit Date: 2026-07-18 **Provider:** Wen Sato, MD

Subjective: Patient presents with acute low back pain, onset 5 days ago after moving furniture at home. No prior episodes of similar pain. Patient mentions a history of physical therapy for a right shoulder impingement injury, completing 6 weeks of sessions at ShoulderCare Rehab ending in March 2026. Denies numbness in the legs.

Objective: Straight-leg-raise testing attempted but deferred — patient unable to tolerate the supine positioning required due to acute pain intensity; no result obtained. Paraspinal muscle spasm noted on palpation.

Assessment: Acute low back strain.

Plan: Given severity of pain, requesting MRI lumbar spine. Recommend muscle relaxant and short-course NSAID in the interim.

Electronically signed: Wen Sato, MD
