Ibe Orthopedic Surgery — Consultation Note

Visit Date: 2026-07-08 **Provider:** Samuel Ibe, MD

Subjective: 67-year-old patient with right knee osteoarthritis, symptomatic for over 2 years, now significantly limiting function. See attached radiology report and conservative management summary.

Functional Assessment: WOMAC score administered today: 68/100 (severe). Patient reports inability to walk more than one block without stopping, cannot manage stairs without bilateral handrail support, and reports nightly sleep disruption from pain.

Additional Findings: BMI 31.2, documented today. No warmth, erythema, or effusion of the right knee concerning for infection. No other absolute surgical contraindication identified.

Assessment: Severe right knee osteoarthritis, failed conservative management.

Plan: Recommend proceeding to right total knee arthroplasty.

Electronically signed: Samuel Ibe, MD
